

WHAT IS CLAIMED IS:

1. A wireless transceiver device, the wireless transceiver device being arranged to interface with a roaming device, the wireless transceiver device comprising:

5 computer code for causing static input information to be accepted;  
a memory arranged to store data, the memory further including an editable field, wherein the computer code for causing the static input information to be accepted causes the static input information to be stored in the editable field;

10 computer code for causing a record associated with the roaming device to be generated, the record being arranged to include the static input information stored in the editable field and the data, wherein the computer code for causing the record associated with the roaming device to be generated further causes the record to be stored on the memory; and

15 a processor for executing the computer codes, wherein the memory is further arranged to store the computer codes.

2. The wireless transceiver device of claim 1 further including computer code for obtaining the data, wherein the data is obtained when the roaming device is in communication with the wireless transceiver device.

20 3. The wireless transceiver device of claim 2 wherein the computer code for causing the record associated with the roaming device to be generated includes computer code for causing the record associated with the roaming device to be generated when the roaming device registers with the wireless transceiver device.

25 4. The wireless transceiver device of claim 2 wherein the computer code for causing the record associated with the roaming device to be generated includes computer code for causing the record associated with the roaming device to be generated when the roaming device deregisters from the wireless transceiver device.

5. The wireless transceiver device of claim 1 wherein the static input information is a location associated with the wireless transceiver device, and the computer code for causing the static input information to be accepted include computer code for causing the static input information to be accepted from a source that is external to the wireless transceiver device.

6. The wireless transceiver device of claim 1 wherein the wireless transceiver device is an access point.

7. A transceiver device, the transceiver device being arranged to interface with a first device, the transceiver device comprising:  
means for accepting input information;  
means for storing data, the means for storing the data further including means for storing the input information in an editable field, wherein the means for accepting the input information includes means for providing the input information to the editable field;  
and  
means for generating a record associated with the first device, the record being arranged to include the input information stored in the editable field, wherein the means for storing the data further includes means for storing the record.

8. The transceiver device of claim 7 further including means for obtaining the data, wherein the data is obtained when the first device is in communication with the transceiver device.

9. The transceiver device of claim 8 wherein the means for generating the record include means for generating the record when the first device registers with the transceiver device.

10. The transceiver device of claim 8 wherein the means for generating the record include means for generating the record when the first device deregisters from the transceiver device.

5 11. The transceiver device of claim 7 wherein the input information is a location associated with the transceiver device.

12. The transceiver device of claim 11 wherein the location includes at least one of a longitude, a latitude, and an altitude associated with the transceiver device.

10

13. The transceiver device of claim 7 wherein the transceiver device is an access point.

14. The transceiver device of claim 13 wherein the access point is a part of a wireless local area network, the transceiver device further including:

15

means for obtaining the data from the first device when the first device is in communication with the transceiver device to access the wireless local area network.

15. The transceiver device of claim 14 wherein the means for generating the record associated with the first device includes means for placing the data obtained from the first device in the record and means for placing the input information stored in the editable field in the record.

20

16. The transceiver device of claim 15 wherein the means for generating the record further includes means for obtaining the input information from the editable field.

25

17. A method for utilizing a transceiver device, the transceiver device having a communications range, the method comprising:  
receiving static information into an editable field stored in memory associated  
with the transceiver device;

30
